## Dial Indicators/Dial Test Indicators

Nomenclature

Dial faces

### 0.01 mm

Continuous dial (Dual reading)

Continuous dial (Reverse reading)

Balanced dial (Multi-revolution)

Balanced dial (One revolution)

### 0.001 mm

Continuous dial (Dual reading)

Balanced dial (Multi-revolution)

Continuous dial (Double scale spacing) Balanced dial (One revolution)

## M/itutoyo

## Mounting a Dial Indicator

Method
Notem
mounting

## Dial Indicator Contact Point

- Screw thread section is standardized on M2.5x0.45 (Length: 5 mm ).
- Incomplete thread section at the root of the screw shall be less than 0.7 mm when fabricating a contact point.

Dial gage and Digimatic indicator positions
Sontact point down
(normal position)
(lateral position)
Contact point up
(upside-down position)

Setting the origin of a Digimatic indicator
Repeatability in the range of 0.2 mm from the end of the stroke
is not guaranteed for Digimatic indicators. When setting the zero
point or presetting a specific value, be sure to lift the spindle at
least 0.2 mm from the end of the stroke.

## Notes on using dial gages and Digimatic indicators

- Do not lubricate the spindle. Doing so might cause dust to accumulate, resulting in a malfunction.
- If the spindle movement is poor, wipe the upper and lower spindle surfaces with a dry or alcohol-soaked cloth. If the movement is not improved by this cleaning, contact Mitutoyo for repair.

## Dial Indicators/Dial Test Indicators

Dial Indicator B7503-1997 (Extract from JIS/Japanese Industrial Standards)

| No. | Item | Calibration method | Diagram of calibration setup | Tools for calibration |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Indication error Adjacent error | Holding the dial indicator with its spindle set vertically downward, follow the procedure prescribed below and determine the error of indication with reference to the dial graduations. <br> First, displace the spindle upward over the entire measuring range while plotting errors at every $1 / 10$ revolution of the pointer for the first two revolutions from the zero point, at every half revolution for the next five revolutions, and at every revolution after the fifth revolution, then reverse the spindle displacement at the end of the measuring range of the dial indicator and plot errors at the same points measured during upward spindle displacement. Determine errors from a bidirectional error curve thus obtained. (Fig. 1) |  | For 0.001 mm or 0.002 mm graduation dial indicators with a 2 mm measuring range or less: A micrometer head or other measuring unit with $0.5 \mu \mathrm{~m}$ graduation or less and instrumental error of $\pm 1 \mu \mathrm{~m}$ and a supporting stand. For dial indicators other than the above: A micrometer head or other measuring unit with $1 \mu \mathrm{~m}$ graduation or less and $\pm 1 \mu \mathrm{~m}$ instrumental error and a supporting stand. |
| 3 | Retrace error |  |  |  |
| 4 | Repeatability | Apply the contact point of the dial indicator perpendicularly to the upper face of a measuring stage, displace the spindle quickly and slowly five times at a desired position within the measuring range and determine the maximum difference between the five indications obtained. |  | Measuring stage Supporting stand |
| 5 | Measuring force | Holding a dial indicator with its spindle set vertically downward, displace the spindle upward and then downward continuously and gradually and take measurements of the measuring force at the zero, middle, and end points in the measuring range in both the upward and downward directions. |  | Supporting stand <br> Top pan type spring scale (graduation: 2gf or less) or force gage (sensitivity: 0.02 N or less) |

Maximum permissible error of indication

|  | Graduation and measuring range |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0.01 mm | 0.002 mm |  | 0.001 mm |  |  |
| Measuring range | 10 mm or less | 2 mm or less | Over 2 mm and up to 10 mm | 1 mm or less | Over 1 mm and up to 2 mm | Over 2 mm and up to 5 mm |
| Retrace error | 5 | 3 | 4 | 3 | 3 | 4 |
| Repeatability | 5 | 0.5 | 1 | 0.5 | 0.5 | 1 |
| Indication 1/10 revolution *1 | 8 | 4 | 5 | 2.5 | 4 | 5 |
| error $\quad 1 / 2$ revolution | $\pm 9$ | $\pm 5$ | $\pm 6$ | $\pm 3$ | $\pm 5$ | $\pm 6$ |
| One revolution | $\pm 10$ | $\pm 6$ | $\pm 7$ | $\pm 4$ | $\pm 6$ | $\pm 7$ |
| Two revolutions | $\pm 15$ | $\pm 6$ | $\pm 8$ | $\pm 4$ | $\pm 6$ | $\pm 8$ |
| Entire measuring range | $\pm 15$ | $\pm 7$ | $\pm 12$ | $\pm 5$ | $\pm 7$ | $\pm 10$ |

Remark
Performance: Maximum permissible errors of a dial indicator shall comply with the table above.
Permissible errors of indication shall be evaluated inclusive of the uncertainty of calibration.

## Miltutoyo

Dial Test Indicator B7533-1990 (Extract from JIS/Japanese Industrial Standards)

| No. | Item | Calibration method | Diagram of calibration setup | Tools for calibration |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Wide-range accuracy | (1) For an indicator of 0.01 mm graduation: Displace the contact point so as to move the pointer clockwise in increments of 0.1 mm with reference to the graduations from the zero point to the end point of the measuring range while taking readings of the calibration tool at each point and determine this accuracy from the error curve drawn by plotting the differences of each "indicator reading - calibration tool reading". <br> (2) For an indicator of 0.002 mm graduation: Displace the contact point so as to move the pointer clockwise in increment of 0.02 mm with reference to the graduations from the zero point to the end point of the measuring range while taking readings of the calibration tool at each point and determine this accuracy from the error curve drawn by plotting the differences of each "indicator reading - calibration tool reading". The instrumental error of the calibration tool shall be compensated prior to this measurement. |  | Micrometer head or measuring unit (graduation: $1 \mu \mathrm{~m}$ or less, instrumental error: within $\pm 1 \mu \mathrm{~m})$, supporting stand |
| 2 | Adjacent error |  |  |  |
| 3 | Retrace error | After the completion of the wide-range accuracy measurement, reverse the contact point from the last point of measurement while taking readings at the same scale graduations as for the wide-range accuracy measurement and determine the retrace error from the error curve plotted. |  |  |
|  | a | Holding the dial test indicator with its stylus parallel with the top face of the measuring stage, displace the contact point quickly and slowly five times at a desired position within the measuring range and determine the maximum difference in indication. |  | Measuring stage, Supporting stand, and Gauge block of grade 1 as stipulated by JIS B7506 (Gauge block) |
| 4 | Repeatability | Holding the stylus parallel to a gauge block placed on the measuring stage, move the gauge block to and fro and left to right under the contact point within the measuring range and determine the maximum difference in indication. |  |  |
| 5 | Measuring force | Holding an indicator by the case or stem, displace the contact point gradually and continuously in the forward and backward directions respectively and take a reading of measuring force at the zero, middle and end points of the measuring range in each direction. <br> Performance <br> The maximum measuring force in the forward direction shall not exceed 0.5 N . The difference between the maximum and minimum measuring forces in one direction shall not exceed 0.2 N (20gf). Note that the smallest possible measuring force is desirable for indicators. |  | Top pan type spring scale (graduation: 2gf or less) or force gage (sensitivity: 0.02 N or less) |

- Accuracy of indication

Permissible indication errors of dial test indicators are as per the table below.
(Unit: $\mu \mathrm{m}$ )

| Graduation (mm) | Measuring range (mm) | Wide range accuracy | Adjacent error | Repeatability | Retrace error |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0.01 | 0.5 | 5 | 5 | 3 | 3 |
|  | 0.8 | 8 |  |  |  |
|  | 1.0 | 10 |  |  | $4^{*}$ |
| 0.002 | 0.2 0.28 | 3 | 2 | 1 | 2 |

${ }^{* 1}$ : Applies to indicators with a contact point over 35 mm long.
Remarks: Values in the table above apply at $20^{\circ} \mathrm{C}$.

## Dial Test Indicators and the Cosine Effect

The reading of any indicator will not represent an accurate measurement if its measuring direction is misaligned with the intended direction of measurement (cosine effect). Because the measuring direction of a dial test indicator is at right angles to a line drawn through the contact point and the stylus pivot, this effect can be minimized by setting the stylus to minimize angle $\theta$ (as shown in the figures). If necessary, the dial reading can be compensated for the actual $\theta$ value by using the table below to give the true measurement.
True measurement = dial reading $x$ compensation value

## Compensating for a non-zero angle

| Angle | Compensation value |
| :---: | :---: |
| $10^{\circ}$ | 0.98 |
| $20^{\circ}$ | 0.94 |
| $30^{\circ}$ | 0.86 |
| $40^{\circ}$ | 0.76 |
| $50^{\circ}$ | 0.64 |
| $60^{\circ}$ | 0.50 |

## Examples

If a 0.200 mm measurement is indicated on the dial at various values of $\theta$, the true measurements are: For $\theta=10^{\circ}, 0.200 \mathrm{~mm} \times .98=0.196 \mathrm{~mm}$ For $\theta=20^{\circ}, 0.200 \mathrm{~mm} \times .94=0.188 \mathrm{~mm}$ For $\theta=30^{\circ}, 0.200 \mathrm{~mm} \times .86=0.172 \mathrm{~mm}$

[^1]
[^0]:    Continuous dial: For direct reading
    Balanced dial: For reading the difference from a reference surface
    Reverse reading dial: For depth or bore gage measurement
    One revolution dial: For error free reading of small differences

[^1]:    Note: A special contact point of involute form can be used to apply compensation automatically and allow measurement to be performed without manual compensation for any angle $\theta$ from 0 to $30^{\circ}$. (This type of contact point is custom-made.)
