Mitutoyo

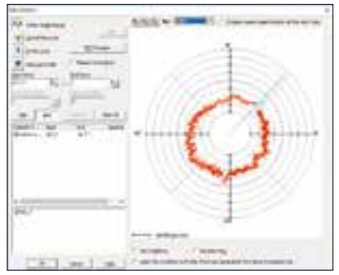
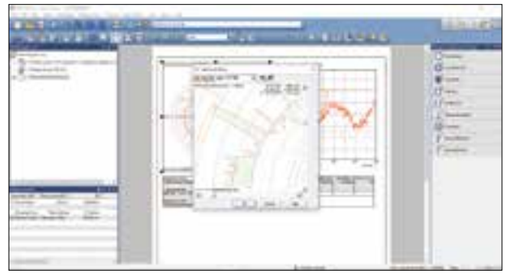
This entry-level desktop tester incorporates the ROUNDPAK multi-analysis evaluation program, which provides it with analytical power close to that of more elaborate models. This is, therefore, a highly functional multi-analysis roundness measuring machine that is suitable for use not only in measurement rooms, but also in research and development sections.

Measurement screen makes ample use of graphs

Multi-analysis function

Complete with a wide range of functions including partial enlargement, auxiliary line setup, color change, displacement/angular difference of data between two points, and so on. Also equipped with notch processing and graph reading functions, which make the machine useful in research departments. Recalculation can also be performed with the filter and evaluation method changed.





Simplified layout function

Computation results for multiple items can be laid out in multiple forms on a single sheet and printed.
This function also supports output to a color printer (optional).

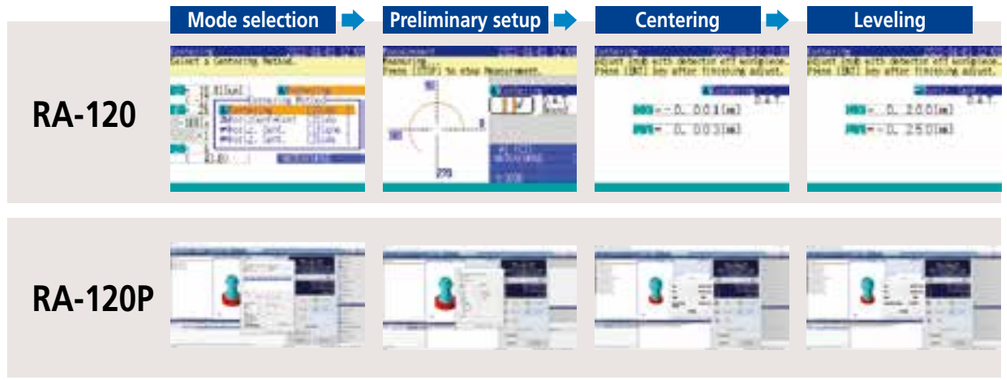
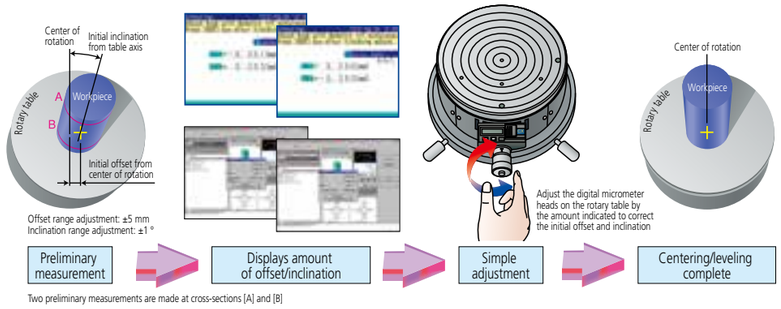
Functions that implement greater efficiency of measurement and range of analysis types

D.A.T. function *except for centering/leveling device (analog micrometer heads)

This instrument uses the D.A.T. (Digital Adjustment Table) function available on more sophisticated models, and this provides powerful support for centering and leveling operations. To perform such operations, the user need only adjust the digital micrometer heads attached to the rotary table by the amounts indicated by the display. This function also supports measurement of notched workpieces.





Two preliminary measurements are made at cross-sections [A] and [B]

Continuous ID and OD measuring function

This function comes in very handy when outside diameter and inside diameter surfaces need to be measured repeatedly, for example, with respect to coaxiality, deviation in wall thickness, etc. The inner surface can be measured and evaluated with the detector, maintaining the same measuring position for the outside diameter without changing its orientation, as illustrated on the right.
Inside diameters down to 50 mm can be measured.

Continuous inside and outside diameter function (inside dia. surface)

Continuous inside and outside diameter function (outside dia. surface)

Z-axis scale

This scale is useful when the measuring height position needs to be entered, such as when measuring coaxiality, etc. The machine uses an ABS Digimatic scale unit to provide an effective means for repetitive measurement and position setting.

IN/OUT switchable wide-range detector

The range of this detector has been extended from that of a conventional lever head by as much as four times, and is now wider than ever before. The detector can provide sufficient margin for centering and leveling jobs, or when measuring large differences. Moreover, the measuring direction can be switched between inside and outside diameters with a single touch of a button.
